Platform-Independent Model (PIM) The Platform-Independent Model (PIM) of XCase Product Key is UML-like class diagram for conceptual modeling of XML data developed during the last two years in Sofia, Bulgaria. It is basically a simple extension of the UML to provide the following functionalities: Automatic generation of data view from a PIM diagram Systematic grouping of the elements contained in a data view Table of properties defined in a data view Isolated description of the process between the UML diagram elements Platform-Specific Model (PSM) Based on the PIM data view definition you can derive an XML schema that describes a data view. The schema is a set of rules that specify the design of the XML document that will be derived from the PIM diagram. XML Schema (XSD) is obtained by applying the aforementioned PSM rules over the PIM diagram and it serves as an exportable format for the data view definition. XCase editor To be able to work with the UML-like class diagrams you need a rich source code editor supporting UML data and not just XML data. The XCase editor runs under Eclipse IDE (Indigo), which is used to edit the diagrams. Also you need graphical tools of model-to-view mapping. Such tools are available in XCase. The editor consists of a tree-view tabular panel plus a special section for the elements of the model. The tree-view tabular panel in XCase is similar to the UML class diagram. When the user clicks on a diagram element in the left hand side, another panel pops up containing its corresponding box in the

middle of the window. The right hand side contains the list of properties and sub-elements of this element. There is also a special place for a person's comments. You can add comment text in the comment pane by clicking on the add comment button in the bottom right corner. Installation instructions Supported platforms Windows XP, Vista, 7, 8, 8.1; Android 2.2 and later. Supports plug-ins: Eclipse, IBM Rational Windchill V8 Other features Program supports XSD Schema compliant with the following XML data formats: Standard document format for text documents (ISO8859-1); Standard document format for binary documents (ISO8859-2); Standard document format

\subsubsection{The XCase Platform-Specific Model}

The Platform-Specific Model (PSM) diagram is a class model where the classes represent the set of XML types applicable for modeling your business concepts. The model is represented on the left panel where you can see the current status of the diagram (which is also visible on the main scheme shown in the upper left of XCase). These status

icons are explained below: \begin{description} \item[**MorphX**] A machine in a given state (turning or stationary) \item[**TransX**] A machine in the state of transition between two previous states

\item[**ActX**] An action to be performed by the machine

\end{description} This model is implemented on the PSM root node (XSEM) in contrast to UML class diagrams which are implemented on class extending from XSEM. Please note that these two are different classes and have different inheritance properties; in other words, if you implement the class diagram in XCase you will obtain a class extending from PSEM and if you implement the model in UML you will obtain a class extending from XSEM. This is because when you use the diagram editor, you are specifying the instantiation and inheritance properties of the objects which are declared in the `` XML tags (see Sect. \ref{Seq:XCase_BusinessProcess}). The difference between the two models is that the diagrams in XCase are obtained from the diagrams in UML, which in turn are derived from the diagrams in PSM. \pagebreak As you can see below, for example, the class shown in the lower-right of the diagram is represented in concrete form by a concrete type of XML (class ``MordorFly'') and the elements in the diagram come from these concrete types. However, the class diagrams cannot be treated on the same level as the data represented by the XCase model (which is what you would expect from a UML model). \begin{description} \item[!]

What's New in the?

1. XCase is a model-driven UML profile for XML Schema, developed by the team from CAU St. Gallen. 2. It implements the following ontology: a. Class Diagrams as PIM (Platform Independent Model); b. Concrete Representation Diagrams as PSM (Platform Specific Model); c. Related Implementations Diagrams as PSM (Platform Specific Model). 3. XCase supports the MDA (Meta-Data-Driven-Architecture) and is a model-driven application, being aware of both conceptual and nitty-gritty data models. 4. XCase treats data types in a modular way, so that each type can be more easily defined, included into a schema and exported. XCase supports inheritance between types. In addition, the app supports MDA-based extended rules for schema creation (Name generator). 5. XCase also supports the simplest type of meta-data for semantic modeling, that is, the universal type: simple types of data are a sequence of simple types (like required, optional, restricted, etc.) and can be part of a more complex type, a composite type, which represents a way to describe complex types. 6. XCase was developed using the toolbox and modeling technology of CDM (Conceptual Data Modeling): XMind (an open source UML-to-XSD conversion toolkit. 7. XCase incorporates the following techniques: a. Schema-Driven Development (SDD), a paradigm for developing DDD technologies; b. All-Inclusive Architectural Decomposition (AID); c. XML Schemas driven by Conceptual Data Models (XSDs) (CDM); d. XML Schemas driven by the minimum set of meta-data (XSDs); e. XML Schemas as PIMs (Platform Independent Models); f. XML Schemas as PSM (Platform Specific Models); g. Concrete Representation Diagrams as PSM. ...and many more! 8. The XCase Application provides an Environment a. for defining a conceptual model of XML Schema data; b. for creating XML schemas from a PIM and/or a PSM

System Requirements For XCase:
